Question:

Write a code and connections in wokwi for the ultrasonic sensor. Whenever the distance is less than 100cms send an "Alert" to IBM cloud and display in the device recent events.

Solution:

Code:

Explanation of Program:

Initially, we have imported the <Wifi.h> and <PubSubClient.h> header files as they are needed to connect wifi and MQTT Protocol. Then, Define Trigger pin and Echo pin values where the ultrasonic sensor is connected with ESP32 module. Then, Define the IBM Account Credentials such as ORG, Device_Type, Device_ID and Token. Also define the server, publishTopic, SubscribeTopic, authMethod, Token and ClientID. Create Object for WifiClient and PubSubClient.

Then, Start the void Setup() Function, Begin the Serial Monitor and set PinMode of Trigger Pin as Output and Echo Pin as Input and call wificonnect() and mqttconnect() to initialize wifi and mqtt Connection and Define their methods to make the Connection.

Then, Begin the void loop() function, digitalWrite HIGH to Trigger Pin and create a delay of 10 microseconds and write back LOW. Then, use pulseIn() function with Echo Pin to calculate the Duration and calculate the distance. If the Distance is less than 100cm call PublishData() Function to publish the Data to IoT Watson Device.

Finally, Define the PublishData() function with message as parameter. Then Define string that contains the payload with the message to be sent in the Json Format. Call Client.publish() function with publishTopic and payload as parameter. Also define the wificonnect() and mqttconnect() to make intial connection with wifi and mqtt connection.
